

- What parts of the OAuth flow are working correctly?
When run locally, my whole application works. When deployed on the cloud I get the issue (Error 400: redirect_uri_mismatch).
- What parts of the OAuth flow are not working correctly?
So the part of the OAuth flow that is not working when deployed is when authenticating the user. I get the error (Error 400: redirect_uri_mismatch). However, when running my program locally I am able to get the users results.
- What do you think the issue is? How would you go about debugging and fixing the issue if you had more time?
If I had more time, I would go to office hours to get some help with this issue. Since, I don't want to break my code before I turn it in, I've been doing some debugging and haven't tried to change the code.

Note: I didn't add my google url into the main.py since if you want to run the program to see if what I said is correct. I have already deployed the project at : [Assignment 6 - Oauth \(joining-in.uw.r.appspot.com\)](https://in.uw.r.appspot.com).

Here is what happens when the program is run locally:
