

I think GitHub is a restful API. The reason I think this, is because, for an API to be considered restful it has to have a client-server architecture using request managed though HTTP, there needs to be a stateless client-server communication, etc. GitHub API is considered RESTful, since the API uses HTTP requests to access and use data. In this Assignment we use the GET, POST, PATCH, PUT, and DELETE. From this we are able to get information from GitHub in the form of a JSON file.
